LIGHTCARE Without Limits

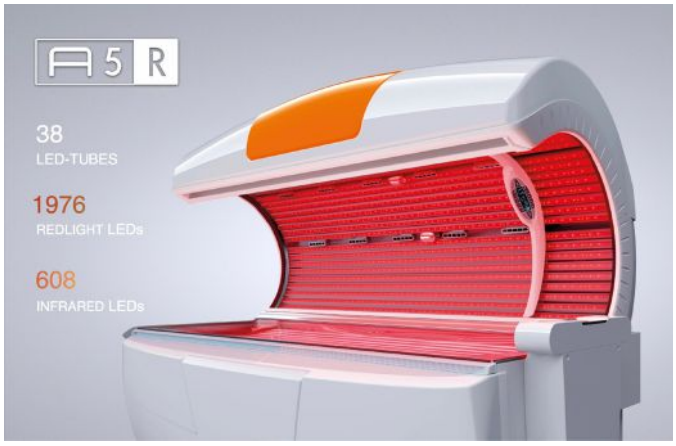

KBL A5R & K5R

With the arrival of the A5R and K5R, KBL has also introduced new terminology to define what its latest LED systems deliver: LIGHTCARE.

THESE two units take the LED red and near-infrared light delivery system behind KBL's flagship R11 Air and deploy it using smaller frames the company has already field-tested for comfort and operation. The result is LIGHTCARE that isn't limited by room size or budget—putting it within reach of operators across the market.

ONE SYSTEM, TWO FRAMES

The A5R and K5R utilize identical LED delivery systems—38 LED tubes, 1,976 red light LEDs and 608 infrared LEDs. Both produce greater than 500 W/m² of irradiance at point of contact, which works out to a dose of greater than 60 J/cm² over a 20-minute session. What separates them is the frame and presentation.

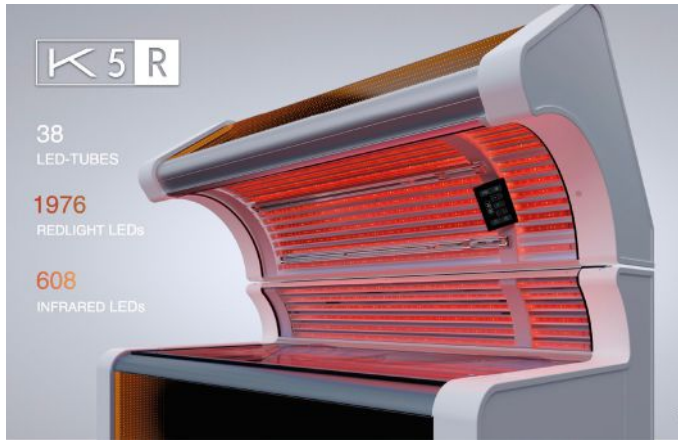

The A5R is built on one of KBL's traditional frames—the larger of the two, for the operator who wants a full-size unit with presence on the floor. It carries an integrated sound package and KBL's Easy Control operation and delivers LED red light and infrared in a more economical package than the flagship.

The K5R brings the same system to KBL's compact K Series frame, engineered for the smaller rooms that make up the majority of salon floor plans. The K5R helps keep those footprints intact while allowing operators to embrace LED red light and infrared, along with the K Series' comfort and operational features—a 7 inch SmartControl, wireless charger, infinity mirror and sound package among them.

Either way, the LIGHTCARE delivery is the same. The choice comes down to the space you have and the presentation you want to experience.

THE LINEUP

The R11 Air remains KBL's flagship in the red and infrared light delivery space, producing 753 W/m² for a 90 J/cm² dose over a 20-minute session. Its hallmark design elevates the presentation of wellness services, but its core advantages are sophisticated software control, user experience, and the scope of performance data backed by FDA 510(k) clearances. The A5R and K5R deliver those same red and near-infrared wavelengths at a lower dosage level and are recognized to provide a similar range of effects. The destination is the same; the difference is how quickly a client gets there.

The A5R and K5R are more economical and more space-conscious. They're designed to meet whatever a given salon needs most.

Whether a salon isn't ready to go all in on the R11 Air but wants a first step into LIGHTCARE, already has an R11 Air booked around the clock and needs to add capacity, or simply wants to turn one of its lowest-performing rooms into a high-value wellness offering, there's now a unit built to fit the room, the budget and the goal.
